

iDENTify: Dental Patient Information and Treatment Tracker

A Capstone Project

Presented to the Faculty of
the College of Computing, Arts and Sciences
Lyceum of the Philippines University - Batangas

In Partial Fulfillment
of the Requirements for the Degree
Bachelor of Science in Information Technology
Specialized in Multimedia Technologies

by:

Jonas R. Castillo
Maru Stephen Almedilla
Joshz Raniel Marasigan

December 2025

APPROVAL SHEET

In partial fulfillment of the requirements for the degree Bachelor of Science in Information Technology (Specialized in Multimedia Technologies), this capstone project entitled “**iDENTify: Dental Patient Information and Treatment Tracker**” has been prepared and submitted by **Jonas R. Castillo, Maru Stephen D. Almedilla, and Joshz Raniel D. Marasigan** for acceptance and approval in a pre-oral examination.

MISCHELLE A. ESGUERRA, DIT

Adviser

Approved by the Panel of Examiners with a grade of _____.

PANEL OF EXAMINERS

MELODY R. DIMAANO, PhD

Chairman

RENIEL LANDICHO, MSIT

Member

VON DERICK G. EBREO, MSIT

Member

Accepted and approved in partial fulfillment of the requirements for the degree Bachelor of Science in Information Technology (Specialized in Multimedia Technology).

ACKNOWLEDGEMENT

We, the researchers, would like to express our deepest gratitude to all those who guided, inspired, and supported us throughout the completion of this capstone project. Without their contributions, this work would not have been possible.

We wish, first and foremost, to always express our deep gratitude to Almighty God for His guidance and blessings. His wisdom, strength, and grace saw us through each challenge and difficult phase of this study.

To our brilliant and patient Capstone project adviser, Mischelle A. Esguerra, DIT, for the invaluable advice, insight, and unending support. Her expertise and dedication greatly helped us navigate the complexities involved in developing our system. Equally, we would like to express our heartfelt gratitude to our respected panel of examiners, Melody R. Dimaano, PhD, Von Derick G. Ebreo, MSIT, and Reniel L. Landicho, for your constructive comments, challenging questions, and meaningful suggestions that helped improve the quality of our work and urged us to refine our project toward excellence.

We also extend our gratitude to the personnel of the Department of Dentistry for their cooperation and support. Their openness in sharing their time and giving us a clear insight into the existing manual Patient Information Record was of great importance to the development of a foundation for our study.

To our beloved families, thank you for your endless love, patience, understanding, and encouragement. Your support during sleepless nights and stressful deadlines has been our greatest motivation and source of strength.

Lastly, to one another, namely Jonas, Maru Stephen, and Joshz, this project testifies team spirit, hard work, and shared vision. We made it possible together.

Jonas R. Castillo
Maru Stephen D. Almedilla
Joshz Raniel D. Marasigan

DEDICATION

This modest work is sincerely dedicated...

To Almighty God, the ultimate source of wisdom, strength, and blessings.

To our devoted families—the Castillo, Marasigan, and Almedilla families—whose sacrifices, prayers, and unwavering faith in us have inspired every step we took. We owe everything we have achieved to you.

To our alma mater, Lyceum of the Philippines University–Batangas, and the Department of Dentistry; it is our privilege to contribute to this system, iDENTify, in alignment with its mission of digital transformation and academic excellence.

And lastly, to the future LPU-B students, researchers, and faculty who will benefit from this system—may it help make your research process smoother, quicker, and more effective.

ABSTRACT

This capstone project presents *iDENTify: Dental Patient Information and Treatment Tracker*, a web-based system developed for the Department of Dentistry of Lyceum of the Philippines University – Batangas. The system replaces the department's traditional paper-based Patient Information Record with a fully digitized and centralized platform, enabling authorized users to manage patient data efficiently. It also includes an integrated module for recording and tracking dental treatments and procedures. Using a user-centered design approach, the researchers gathered requirements through interviews and workflow analysis, then developed and tested the system using modern web technologies. The study concludes that *iDENTify* improves data accuracy, enhances accessibility, and reduces the time spent on manual documentation. The study concludes that the system modernizes the department's record-keeping processes and provides a strong foundation for future digital initiatives in the dental clinic.

KEYWORDS: *Dental Clinic, Dentistry Department, Digital Documentation, iDENTify, Log Procedures, Patient Information Record, Treatment Tracker, Web-Based System.*

1.0 INTRODUCTION

The integration of technology in healthcare has significantly transformed patient management, improving efficiency, accuracy, and accessibility of medical records (*BMC Medical Informatics and Decision Making*, 2021; *Informatics in Medicine Unlocked*, 2019). However, most clinics and dental institutions still rely on outdated patient information systems, including standalone computer databases or paper-based records. The stated methods often result in inefficient workflows, misplaced files, and difficulties in retrieving critical patient data when needed. As time passes dental care continues to evolve, the need for secure patient information system and its efficiency becomes increasingly evident.

Electronic health record (EHR) use in dentistry is often praised for its clear benefits. According to Benoit et al. (2022, *BMC Oral Health*) showed that fully integrated EHRs improve data accuracy, make information easier to find, and improve clinical results. Their study highlighted the benefits of combining diagnostic findings, medical histories, and treatment plans in one digital space. This setup makes sure that

important patient information is easily accessible during routine care. However, while EHRs have become standard in most medical fields, dental practices have adopted them more slowly. Many still rely on disconnected, mostly paper-based data management systems.

A 2023 paper in the *Journal of the Nigerian Society of Physical Sciences* highlighted the issues with fragmented data systems in dentistry. The authors mentioned that without a consistent method to handle patient information, clinics end up with disorganized records. This leads to inefficient workflows and poor communication among providers. They advocated for unified digital platforms that connect dental teams with the wider healthcare network. They stated that easy data sharing is essential for safer and better-coordinated care.

At the Lyceum of the Philippines University, Batangas (LPU-B) College of Dentistry, preparing future clinicians goes beyond teaching cavity preparations and rubber-dam placement. It requires getting them familiar with digital charting environments they will face after graduation. Handling patient data well is now an important clinical skill. This skill

is vital for every diagnosis, treatment plan, and transition between student and supervisor. However, the continued use of paper encounter forms, separate Excel files, and manually updated index cards creates challenges that slow down both the learning process and the daily activities of the clinic.

To solve these problems, the researchers created iDENTify, a web-based Dental Patient Information and Treatment Tracker for the LPU-B College of Dentistry. This platform gathers each patient's medical and dental history, proposed treatments, and all relevant clinical data in one searchable chart. Students on clinical rotation use it to log encounters, track procedures, and save diagnostic results in real time. This method helps reduce errors from duplication and transcription that often happen with paper processes. Built with common web technologies like HTML, CSS, JavaScript, PHP, and a MySQL back end, the system is easy to maintain and has low deployment costs. Specific role-based permissions ensure that only authorized faculty, interns, or staff can view or edit any record. This setup protects patient confidentiality and

follows the data protection policies set by the institution.

iDENTify is designed primarily for patient record management and treatment tracking and does not include financial transactions. The platform also limits access to its college network, with no connections to hospital information systems, insurance sites, or national health exchanges. This means data transfer is restricted to standard exports that administrators can check as needed.

Within these boundaries, the project supports three United Nations Sustainable Development Goals. Goal 3, Good Health and Well-Being, is addressed by faster and easier access to complete dental records. This reduces duplication, missed allergies, and treatment delays. Goal 9, Industry, Innovation, and Infrastructure, is shown through the cost-effective, open-source stack, which proves that schools with limited resources can still use high-quality digital health tools. Finally, Goal 4, Quality Education, gets stronger each time a student navigates an electronic chart, learns to check data integrity, or communicates with a supervisor in the system. By educating clinicians who expect secure, searchable, shared care

records, LPU-B plays its part in the global effort for fair and sustainable healthcare systems.

OBJECTIVES OF THE STUDY

The purpose of this study was to create a comprehensive patient Information system of dentistry for the Lyceum of the Philippines University – Batangas. The following were the objectives of the study:

1. Design and develop a web-based platform for the dental patient information and treatment tracker at LPU-B College of Dentistry.
2. Generate reports on patient history, ongoing treatments and case progress to assist dental students and faculty in monitoring and assessing patient record.
3. To utilize HTML, CSS, JavaScript, PHP, and MySQL in the development of the system, ensuring a web-based, user-friendly, and responsive platform. Use HTML, CSS, JavaScript, PHP, and MySQL as tools in the development.

2.0 LITERATURE REVIEW

A research study, confirming the effectiveness of web-based systems in dental education and clinical

management, was widely acknowledged and accepted. Such an evaluation method has been instrumental in the refinement of the patient information management system and its merge to the faculties and students. Besides, patient record management is quite necessary to give room for accurate and easily accessible patient histories, efficient treatment planning, and workflow optimization in the dental clinic. This examination is the focal point of five essential topics of the dental information system, namely Dental Record Management System, User Experience (UX) Design in Dental Information Systems, Electronic Health Records (EHR) in Dentistry, Human-Computer Interaction (HCI) in Dental Information Systems, Legal and Ethical Issues, Treatment Tracking Systems in Healthcare Information Management, and MySQL as a Database Management System in Digital Dentistry. This research works to critically review literature that was published from 2019 and to offer wise reflections on the role of web-based solutions in facilitating dental healthcare administration and supporting learning experiences.

Dental Record Management System

Dental Record Management System is a digital system that is utilized to store, categorize, and manage the information of dental patients in dental hospitals and institutions. It makes patient records such as medical history, treatment, diagnostic reports, and appointments documented and easily accessible. These are technological tools that facilitate clinical decision-making, improve the flow of work, and thus, patient care is enhanced through computer-based record-keeping. Besides, if a dental record system is well designed, medical regulations, data confidentiality, and data accuracy are guaranteed. The simplification of administration, less workload, and fewer errors, which are the functions of a highly efficient and properly structured dental practice, are its key roles.

Mthethwa and Matjila (2019) conducted a research on the occurrence of absence or incompleteness of dental records at the Medunsa Oral Health Centre. Their research emphasises the recording of accurate records as a lifeline especially in dental environments, where the incomplete data can be the direct ways of the patients' treatment and

results. They support the documentation changes as a vehicle for the betterment of patient care and clinical auditing. This is a very significant point about having the information systems integration, for example, iDentify, which is a way of solving the problems of making the patient data complete and easily accessible.

In the opinion of Mortazavi et al. (2019), gathering medical histories of patients in the field of dentistry should be a priority not only for the provision of quality care but also for legal documentation and forensic investigations. The authors promote detailed recording as a way to improve patient safety and the success of treatment. Such a view is consistent with the need for a thorough information system like "iDentify" which can facilitate the correct recording and hence quick retrieval of patient data leading to improved clinical results as well as adherence to law requirements.

In the opinion of Mortazavi et al. (2019), obtaining medical histories of patients in the dental field should be the first priority not only for the provision of quality care but also for legal documentation and forensic

investigations. The authors advocate detailed recording as a means of enhancing patient safety and treatment effectiveness. This opinion aligns with the necessity of a comprehensive information system such as "iDentify" that can support accurate recording and therefore be able to retrieve patient data quickly, which results in better clinical outcomes and compliance with legal requirements.

User Experience (UX) Design in Dental Information Systems

User-friendly interfaces enhance the interaction of dental practitioners, faculty, students, and information systems. Properly designed UX in dental systems ensures that the system is user-friendly, efficient, and accessible, thus it will have a positive effect on the workflow of patient management. It involves understanding user requirements, simplifying navigation, and the use of interactive features that facilitate the process. As a result of the implementation of UX principles, dental information systems are able to raise the level of engagement, reduce the number of errors, and offer a smooth experience to both faculty and students who use the platform.

Troop et al. (2020) offers in-depth understanding of the User Experience Design for Learning (UXDL) framework from the viewpoint of undergraduate students. The authors emphasize the vital role of user experience in the design of learning systems, which in turn, can be an essential tool while creating a comprehensive Patient Information System for Dentistry. Knowledge of students' perception and usage of educational technology can be a guide toward the construction of easy-to-use and efficient systems for dental practice management.

Hartson and Pyla (2019) paper centers on the evaluation of User Experience (UX) aspects and emphasizes the necessity to understand factors that influence UX in web applications. The primary objective of this investigation is to provide a detailed survey of UX concerning different parameters and to assign scores for each parameter to compute the overall UX score for web applications. Moreover, this advanced model generates a set of recommendations for the improvements of the areas correspondingly to the evaluation that will result in enhancing users' satisfaction calling for better

utility, convenience, and higher quality of interaction with programs, services, and systems.

Electronic Health Records (EHR) in Dentistry

Incorporation of Electronic Health Record (EHR) systems has been a great success in patient information management in the dental practice. With EHRs, the storing, seeking, and sharing of patient information become simple, which enables a better communicational flow between dental professionals and also the patient's overall care gets improved. Besides, EHR systems provide easy access to patient history, treatment plans, and imaging diagnostics that in turn help clinical decision-making. The use of EHRs in conservative dental practice ensures accurate records and continuous care.

Levitin et al. (2019) done a retrospective review of the completeness of electronic dental records of the student clinic. The research was to a great extent directed at the evaluation of the completeness of the electronic records of patients in the student clinic through the comparative analysis of validated cases of alveolar osteitis treated between August 2011 and May 2017. A big difference was found by the

investigation between the frequency of the index category in alveolar osteitis cases documented by dental students and that of the population which suggests the need for more emphasis on clinical documentation skills of dental students in their educational process.

The research done by Kordbacheh et al. (2019) on a dental school in the U.S. Electronic health records is the focal point of the study that was conducted to establish the prevalence, incidence rate, and risk factors of peri-implantitis. The research features EDRs utilization for investigatory goals and raises electronic dental records' turning point role in revealing the predictors and risk factors that may lead to dental conditions. This is an indication of how important electronic health records are in dental research and clinical practice.

In their review of the literature, Benoit et al. (2022) map out the evolution and current state of dental informatics as a subset of the broader health information system. They trace notable technological and methodological progress over the last half-century, including the emergence of standard clinical coding schemes, data

collection techniques, and the use of clinical data for new purposes in dentistry. They advocate that dental EDRs, being a crucial part of health information systems, not only facilitate easy documentation but also efficient management of patients' medical and dental histories. Their research reveals that while the uptake of EDRs has significantly accelerated, notably in large clinics, there remains a demand for more pedagogical research addressing the effects and effectiveness of these innovations in dental practice. This research offers the necessary background knowledge of technological progress in dentistry that is relevant to present-day dental practices and research about patient information systems.

The study conducted by Simon et al. (2020) draws attention to interoperability as a vital facet of electronic dental records, emphasizing the interrelation of dental records with general health records, which include allergies and chronic conditions. Such interdependence is vital for holistic patient care as it promotes improved clinical decision-making, and the entire process of healthcare delivery gets enhanced. The results show that an

efficient patient information system like "iIdentify" could be greatly influenced by that interoperability, thus ensuring that dental care is not detached from the overall context of patient care.

Human-Computer Interaction (HCI) in Dental Information Systems

Human-computer interaction (HCI) plays an important role in creating dental information systems that are easy to use and can efficiently handle patient data.

Jagatheesaperumal et al. (2022) investigated ways that HCI concepts could improve the practicality of healthcare solutions, which include those used in dental clinics. Their study points out that putting the user at the center of the design is the key factor in making interfaces not only supportive of dental practitioners' work but also helpful for patients' involvement. Such an approach elevates the entire user experience, thus enabling better data management and patient communication in dental health practices which in turn is vital for patient care and satisfaction.

UI design is the manner in which the user can utilize a computer via a gadget (Churchville, 2021).

The UI works as a connection between users and the system that is

being used. Good UI is very important because it is the first thing that users see and use. Apart from its visual aspect, the UI should also be user-friendly (Kusuma et al., 2022).

Quality of UI design may significantly lower the technophobia in users. Hence, the UI design plays a major role in users' willingness to adopt technology (Cheng, 2021). There exist various methods that are employed in UI design, among which is Design Thinking (DT). DT is an innovative design tool that targets user needs and can be the source of business innovations (Kwon et al., 2021). This technique keeps users involved in every step until the final product is done.

Chenna (2019) that emphasis the user-centered design involved the repeated processes, especially the prototyping for interaction systems. The paper underlines the significance of prototyping, testing and evaluation as a means of improving interactive systems for the users in the long run. Through the use of iterative design approaches, designers have the capability of perpetual upgrading of the user.

Legal and ethical issues in digital dentistry

The changes and new challenges that come with using digital technology in dental practice. Among these are maintaining the confidentiality of the patient, getting informed consent, and abiding by the laws related to digital records and telemedicine. Ethical issues stress patient autonomy, good communication about treatment options, and fair access to the latest technology. Legal issues revolve around healthcare law compliance, following patient data security rules, and safety checks for digital tools. It is very important to follow these legal and ethical rules if the goal is to be sure that the rights of patients and dental practitioners are there, while at the same time, digital solutions are used in the right way in modern dentistry.

Furnari (2019) put great emphasis on ethical principles, especially on the informed consent aspect, in clinical dental hygiene cases. To get the informed consent, it is necessary that the patients have full knowledge of the procedures, the risks that may occur, the benefits, and even the various choices such as not doing the treatment at all. This whole process is essential in giving patient autonomy the respect it deserves as well

as in compliance with the standards of professional practice.

Ministry of Health Regulation No. 20 of 2019 on the Provision of Telemedicine Services between Healthcare Facilities governs telemedicine services, including teledentistry. It should be conducted under the regulations currently enforced, and support the facts that consultations are held by licensed doctors and that patient data are safeguarded. These restrictions are there to make sure that the quality and safety standards for services provided remotely are at the same level as those for services physically conducted in health care facilities.

Informed consent is not simply a form that has to be filled out; it is a communication process that aims at involving patients in decisions about their care. Dentists need to explain the procedures clearly and thoroughly, including the technology involved, so that patients will be in a position to make their own decisions. It is a very important thing in giving patients autonomy the respect it deserves and also the compliance with good professional practice standards. Both patients and

dentists are deserving of protection by the law due to informed consent.

Beauchamp (2019) presented a firm support of common biomedical ethics principles as a basis. Maintaining patient confidentiality and facilitating access to progress in dental care technology without discrimination are some of the ethical aspects of digital dentistry. These basic ethics serve as a guide for the safe and fair use of technology in health care and at the same time provide solutions to legal and ethical issues that come along with digitization of patient data.

The study of Jenie and Lestari (2019) dealt with philosophy behind consent, refusal to consent and recording medical information in medical records. Informed consent is the pivotal element when it comes to incorporating digital technology in dentistry and the patients must be told such that they understand its use, risks, and benefits. So, it can be said that informed consent is the key to putting the patient in the driver's seat, which is their basic right in the healthcare system. Informed consent is a very important part when digital technology is utilized in dentistry. According to Law No. 29 of 2004 on Medical Practice, patients should

be properly informed about the digital technology being used in their treatment, including the possible risks and benefits. This guarantees that patients are in a position to give their informed consent, which is their basic right to healthcare.

The quality and safety of digital devices that are used in medical fields, including dentistry, are regulated by the Ministry of Health Regulation No. 1189/MENKES/PER/IX/2010 on the Safety of Medical Devices and Healthcare Products. Devices and instruments that are digitally driven and used in dental practice must be of the quality and safety standard that is set to ensure that the equipment is safe for use and efficient in diagnosis and treatment by the government and regulatory bodies.

Treatment Tracking Systems in Healthcare Information Management

Treatment tracking systems refer to digital means that are meant to save, watch, and handle the treatment progress, medicine schedules, and health outcomes of patients. These systems enable medical staff to guarantee that patients follow the drugs prescribed to them and give the opportunity to doctors to have a better view of the recovery process. Mason et al. (2022) in their article "Digital Treatment Tracking Systems" report that

compliance and monitoring can be much more effectively done through the use of digital treatment tracking systems than by using traditional paper-based records.

Research into digitalized treatment trackers has proved their effectiveness in raising the medication adherence level of patients. Especially those suffering from chronic illnesses, for example, diabetes, hypertension, and tuberculosis. A systematic review by Santo et al. (2023) revealed that both mobile-based and electronic treatment tracking systems had considerable effects on medication adherence rates and, as a result, the number of missed doses was reduced due to automated reminders and progress monitoring. Their findings have shown how important treatment trackers are in changing patients' behavior and improving clinical outcomes.

In addition to that, treatment tracking systems offer a real-time option of accessing patient health data, thus the healthcare personnel can be on the go and still be able to quickly check the treatment status, confirm if there are any delays and, if it is the case, intervene. Zhang et al. (2023) are of the opinion that digital patient tracking systems empower clinical decision-making as they present

the latest and correct information about patient treatment, which lessens medical errors and helps improve patient safety.

Moreover, electronic treatment tracking contributes to the betterment of data management and care continuity. The research done by Kumar and Suresh (2024) pinpointed the benefits of electronic tracking systems in cutting down data duplications, having no lost patient records, and speeding up the coordination between the different units of a healthcare facility. The readiness of centralized digital records is a great support for the easy retrieval of patient history, treatment schedules, and progress notes.

Also, the incorporation of treatment tracking into health information systems makes patients more willing and responsible. The review that appeared in *Nature Digital Medicine* (2025) claimed that by self-monitoring and using digital treatment logs, patients are encouraged to take more part in their own healthcare management, which eventually brings about better treatment outcomes over time.

In response to the call for efficient patient monitoring, treatment tracking systems have become necessary features

of healthcare information systems of the present day. The iDENTitfy platform is quite consistent with these conclusions as it offers a well-organized and centralized space for recording patient data as well as treatment progress, thus it is not only improving data accuracy and accessibility but also enhancing clinical workflow efficiency.

MySQL as a Database Management System

Database management systems (DBMS) are at the core of information systems, especially when they are used to manage huge amounts of sensitive records like patient information and treatment data. MySQL is perhaps the most popular relational database management system in use today. It is an open-source DBMS that is acclaimed for its stability, speed, and scalability. Per Oracle Corporation (2023), MySQL is tailored to handle structured data in a very efficient manner by the use of tables, schemas, and SQL-based querying. This makes it a good fit for both enterprise-level and academic applications.

MySQL is quite popular because it is an open-source database, so developers can use it at no cost. Therefore, it is perfect for projects of students and small to medium-sized

systems like a hospital information system that is developed in the academic environment (Datamation, 2023). Besides, MySQL is a multi-user access system which means that two or more users can enter data and get information at the same time without the system being unstable, that is to say, it is a very safe database for a patient treatment tracking system where many medical staff can login to the database concurrently.

In performance aspect, MySQL is tailored to be speedy with data processing by means of indexing, query optimization, and caching mechanisms. Ropstam (2023) pointed out that MySQL is capable of dealing with an immense amount of data in a very efficient manner and at the same time it keeps the response times stable which is vital for systems like patient records, treatment histories, and follow-up data storage.

Besides, MySQL is compatible with various storage engines, InnoDB being the one that is most frequently used for transactional systems. InnoDB offers ACID-compliant transactions, thus it is the ultimate guarantor of data accuracy, consistency, isolation, and durability (Djellouli, 2022).

Healthcare data management cannot be done without security being at the core of it. To prevent patient records from being accessed without permission and to avoid breaches, MySQL provides a set of features which include user authentication, role-based access control, SSL/TLS encrypted connections, and data backup (Oracle, 2023). These security features are vital for the iDENTify system to ensure that the privacy and integrity of the sensitive patient information are maintained.

MySQL is very compatible with web and mobile systems. It works well with programming languages like Java, PHP, Python, and Kotlin. According to Motadata (2023), MySQL's wide compatibility lets developers easily integrate it with various application frameworks, including those based on Android. This makes MySQL a good choice for the backend database of the iDENTify system.

Based on these studies and technical evaluations, MySQL is a dependable, secure, and budget-friendly database management system that works well for patient information and treatment tracking applications. Its performance, ability to scale, and robust data integrity

features support the smooth operation of iDENTify.

3.0 METHODS

This chapter lays out what progress the development of iDENTify: A Dental Patient Information and Treatment Tracker made in terms of research methodology. The WDLC Six Phases mode in the middle shaped the system development and background support of iDENTify. That is, design and production implementation were all carefully guided under expert-level management to ensure high quality throughout every phase of realization. Each phase helped transform requirements into a completely functional web-based platform that meets the needs of LPU-B College of Dentistry.

Web Development Life Cycle

Web development focuses on creating websites and applications for the internet. In a methodical approach, such as the Web Development Life Cycle (WDLC), projects progress through definite and manageable steps. Patel (2022) mentioned that WDLC comprised essential phases, namely Research, Planning, Design and Layout, Development and Testing, and Maintenance. These phases led to the development of iDENTify and enabled

the researchers to adhere to a concrete plan from approach to output. It also ensures that the development and output regarding the maintenance of dental patient records or treatment tracking needs are safe and effective.

Six Phases of Web Development Life Cycle

Figure 1. Web Development Life Cycle

Research Phase

The researchers gathered information regarding the current system used to track patient information at LPU-B's College of Dentistry. The faculty and other heads were interviewed to obtain information concerning the manual record-keeping method and the lack of instant access to students' treatment history. Literature was also reviewed on the general topics of electronic health

documentation, user-focused design and legal aspects in digital dentistry. It was revealed that in order to combine patient profiles, treatment notes and dental charts, a unified digital system was needed. The findings informed the development of preliminary technical specifications and confirmed the need to proceed with iDENTify development.

Planning Phase

The researchers defined the scope, goals, and technologies needed for iDENTify during the planning phase. Set a main goal to create a web system that collects patient information. The system supports treatment monitoring. It also allows students and clinicians to easily access data. The researchers planned to use HTML, CSS, JavaScript, PHP, and MySQL. Also included access controls based on user roles to protect security. Then assessed risks related to information privacy, system use, and technical difficulty. Created timelines, workflows, and deliverables. Divided the work into modules for login, patient records, dental charts, and reports.

Design and Layout Stage

During this stage the researchers was primarily engaged in constructing a functional and user-friendly interface

that would be in harmony with clinical routines. The design is essentially influenced by the paper-based Patient Information Records from the Dentistry Department which were used as a base for the digital system. Created wireframes and mockups for the login page, dashboard, PIR pages, and report generation sections. It was particularly geared towards the user for easy navigation, and a responsive design were supported for different devices. Clinicians were given the option to visually represent and label the conditions on an interactive dental chart integrated into the system. The researchers were devising the database schema which involved user role tables, patient demographic tables, treatment tables, and activity logs. The comments of faculty and staff about the prototype layouts helped to make the changes in the ease of use and interface design.

Development Phase

The actual coding of iDENTify happened during the development stage. To make the front-end interface, the researchers employed HTML, CSS, and JavaScript, while PHP was used for the server-side operations like data processing and user authentication.

MySQL served as the backend database where patient records and treatment history were stored. The Researchers chose to follow modular development, and modules like Add/Edit Patient, Dental Chart Drawing, PIR Pagination, and Report Generation were created and integrated one by one. The researchers adhered to code standards for maintainability and used version control tools for collaboration management. Alongside, they were conducting internal unit tests to check the correctness of each implementation.

Testing and Quality Assurance Phase

The Testing and Quality Assurance phase followed the ISO/IEC 25010 software quality model to ensure that the iDENTify system met essential quality standards. Testing focused on key attributes such as functional suitability, usability, reliability, performance efficiency, security, compatibility, maintainability, and portability. Unit and integration testing ensured that features and modules worked correctly and cohesively, and system testing covered stability and performance. UAT with students and faculty of the College of Dentistry validated whether the system is usable and supported real clinical

workflows. Nonfunctional testing covered data security, responsiveness, cross-device compatibility, maintainability, and scalability of the system. In making sure that the process adheres to ISO/IEC 25010, the researchers ensured that iDENTify is reliable, safe, and user-friendly, suitable for everyday clinical use at LPU-B.

Maintenance Phase

After iDENTify was officially launched, the system naturally transitioned into its maintenance phase a time which the researchers remained in close contact with the end-users to ensure everything worked well. The researchers personally held orientation sessions for clinicians and the faculty, demonstrating to them the features and assisting them in gaining confidence in the use of the new digital system for their Patient Information Record. Regular maintenance became their daily routine. The researchers ensured that data backups were done regularly, security patches were applied on time, and performance checks were carried out to keep the system reliable. As users dug deeper into the system, they asked for more report filters something which the researchers noted for the next releases. To

facilitate the organization and updating of the system, a method for automatically updating statuses was implemented. Patients who had no record of visits or activity for one (1) year were automatically marked inactive, thus helping to remove unnecessary clutter from the database. Similarly, when a clinician finished their studies and officially graduated, the system, in a polite way, changed their account to the inactive status. This guaranteed that the platform always reflected the current, active members of the clinic community. The researchers were very much involved throughout the whole maintenance period. They observed the system's usage, assisted in solving the problems, and ensured that iDENTify was always evolving in a way that was beneficial to both the students and the institution. Their continuous presence was a proof of their commitment not only to the system's evolution but also to the people who depended on it every day.

Figure 2. Role-Based Access Control

This figure presents the Role-Based Access Control (RBAC) architecture used within the system. It depicts the four primary user types; CI, Clinician, COD, and Admin, and clarifies how each role interacts with the platform. The diagram outlines the specific permissions assigned to every role, including their capabilities in accessing, creating, modifying, and managing patient records, as well as overseeing broader system functions. By mapping these responsibilities, the illustration highlights how RBAC ensures appropriate data governance, maintains security, and supports efficient workflow management across all user groups.

Figure 3. Gantt Chart (Pre-Oral)

This figure illustrates the project timeline with tasks, milestones, and team responsibilities across all development stages. It tracks progress and ensures timely completion of deliverables.

Figure 4. Gantt Chart (Final)

The Figure illustrates the sequence and duration of tasks from the initial revisions to the final defense. It highlights how each phase progresses and overlaps, helping the team monitor deadlines and ensure timely completion of all project activities.

4.0 RESULTS AND DISCUSSION

FLOWCHARTS

Figure 5. Login Screen

This Figure illustrates how users can log in to their accounts. In the login screen, users will be required to enter their username and must enter their password to access the account.

Figure 6. Dashboard (Admin)

This figure illustrates the main activity in the Dashboard of Admin. Admin can navigate to the Profile Screen, the Add Patient Screen, admin interact with patient records, which allows them to View, Edit, modify the Status, and Delete a specific Patient Information Record.

Figure 7. Dashboard (Admin)

This figure illustrates a continuation of the Admin Dashboard, highlighting the filtering and search functionalities available to clinicians. Users can filter patient records by entering a patient’s name, specifying a “Date From” and “Date To” range, and selecting the status of the patient. These features allow admin to quickly locate specific patient records, narrow down large datasets, and efficiently manage and review relevant patient information. By providing flexible filtering options, the dashboard enhances usability and supports effective workflow management in patient care.

Figure 8. Patient section (Admin)

This figure illustrates the primary activity within the Admin Dashboard, where administrators can efficiently manage patient-related operations. From this section, the admin can navigate to the Add Patient screen to register new patients, as well as access the list of existing patient records. Within this section, the admin can interact with each record by viewing the patient's details, editing or updating information, modifying the patient's status, or deleting a record when necessary. This activity serves as the central hub for maintaining accurate and organized patient information within the system.

Figure 9. Patient section (Admin)

This figure illustrates a continuation of the Admin Patient section, highlighting the filtering and search functionalities available to clinicians. Users can filter patient records by entering a patient's name, specifying a "Date From" and "Date To" range, and selecting the status of the patient. These features allow admin to quickly locate specific patient records, narrow down large datasets, and efficiently manage and review relevant patient information. By providing flexible filtering options, the dashboard enhances usability and supports effective workflow management in patient care.

Figure 10. Add Patient (Admin, Clinician)

This figure illustrates the Add Patient activity, which is accessed when the user selects the Add Patient option from the dashboard. Upon entering this activity, the user is prompted to input all necessary patient information, such as personal details and other required data fields. Once all information has been provided, the user may click Save to store the new patient record in the system. Alternatively, if the user decides not to proceed with the registration, the Cancel button can be selected to discard the action and return to the previous screen. This activity ensures that new patient data is accurately collected and properly managed.

Figure 11. Delete Patient (Admin)

This figure illustrates the Delete Patient activity, which is initiated when the user decides that a specific patient record needs to be removed from the system. After clicking the Remove option, a confirmation pop-up labeled “Delete Patient?” appears to ensure that the action is intentional. The pop-up provides two choices: Cancel and Yes, Delete. If the user confirms the deletion by selecting Yes, Delete, the system permanently removes the patient record. However, if the user does not wish to proceed or click the option by mistake, selecting Cancel will close the prompt and retain the patient’s information. This activity helps prevent accidental deletions and ensures careful management of patient records.

Figure 12. Patient Information Review (Admin, Clinician, CI)

This figure illustrates the Review activity, which displays the Patient Information record and its pages. The user can interact to view specific pages, which include Personal data, Health Questionnaire, Dental Examination, Inform Consent, and Progress Notes.

Figure 13. Patient Information Record Page (Admin, Clinician)

This figure illustrates the Patient Information Record, where the users can capture an image and a fingerprint of the patient. The user is allowed to edit and save the patient's data. If the user clicks the next button, the user will be redirected to the next page of the PIR.

Figure 14. Patient Information Record (Admin, Clinician) (2nd Page)

This figure illustrates the second page of the Patient Information Record activity, where the user engages with the Health Questionnaire section. In this activity, the user is required to carefully input relevant health-related information about the patient, including medical history, symptoms, and other pertinent details. Completing this section ensures that the patient's record is thorough and accurate, providing clinicians and staff with essential data for proper assessment and care. Once all necessary information has been entered, the user can proceed to the next step in the patient registration or record-keeping process.

Figure 15. Patient Information Record (Admin, Clinician) (3rd Page)

This figure displays the third page of the Patient Information Record, featuring an interactive tooth chart. The user can draw on it using a color palette, input data, and click "Next" to proceed to the fourth page.

Figure 16. Patient Information Record (Admin, Clinician) (4th Page)

This figure illustrates the fourth page of the Patient Information Record Where Informed consent of the patient is visible. The users must complete all the details needed and proceed to click the next button to redirect to the fifth page of the PIR.

Figure 17. Patient Information Record (Admin, Clinician) (5th Page)

This figure illustrates the fifth page of the Patient Information Record. The users input all the data needed and proceed to click the save button. This figure also illustrates the generated reports for clinicians to easily generate a hardcopy of the saved Patient Information Records. The clinicians will click the generated report and redirect to the generated reports page.

Figure 18. Capture Image (Admin, Clinician)

The figure presents the Capture Image activity, which serves as an important step in the patient registration process. In this activity, users are required to take a clear and accurate photo of the patient using the system's built-in camera feature. This interaction ensures that every patient has a corresponding visual record, which enhances identification, minimizes errors, and supports proper documentation. The captured image is then automatically linked to the Patient Information Record, making it a vital element in completing and verifying the patient's overall profile within the system.

Figure 19. Capture Fingerprint (Admin, Clinician)

This figure illustrates the Capture Fingerprint activity, which is used when recording a patient's fingerprint as part of the registration process. In this activity, the user interacts with the system's fingerprint scanner to ensure that a clear and accurate biometric sample is captured. This step is essential because the fingerprint serves as a unique identifier and becomes an important component of the Patient Information Record. By completing this activity, the system enhances patient verification, reduces the risk of duplicate records, and strengthens overall data accuracy within the system.

Figure 20. Log Procedure Section (Admin, Clinician)

This figure presents the Log a Procedure activity, where users record the details of a procedure performed on a patient. In this activity, the user enters all required information, such as the patient's details, the type of procedure, and any relevant notes or observations. After completing the necessary fields, the user submits the information to save the entry. This activity helps maintain accurate documentation of procedures and ensures that each patient's record is kept up to date.

Figure 21. System Users Section (Admin)

This figure illustrates the main activity in system users section User. It displays lists of users (Admin, Clinicians, CIs, and COD). Admins can filter to view each user types, or interact with icons to view details, edit, or delete users. Actions like adding, editing, or deleting users redirect to their respective screens.

Figure 22. Add Users (Admin)

This figure illustrates the user creation process, which allows administrators to register new system users. In this activity, the admin completes the required fields in the Add User form, providing all necessary details such as the user's name, role, and login credentials. Once all information is properly entered, clicking Add User confirms the action and creates the new account. The system then redirects the admin back to the System Users screen, where the newly added user now appears in the updated list. However, if the admin decides not to proceed, selecting Cancel stops the process and returns them to the System Users section without saving any changes. This activity ensures controlled and accurate management of system user accounts.

Figure 23. View User Details (Admin)

This figure displays the User Details View, where administrators can access complete information about a selected system user. In this view, the admin can review all relevant details, such as the user's name, role, status, and other associated account information. This screen allows admins to quickly verify or check user data without making any changes. When finished, the admin can click Close to exit the details view and return to the main System Users section. This activity supports efficient user management by providing a clear and organized overview of individual user profiles.

Figure 24. Edit User Details (Admin)

This figure illustrates the user editing process, where administrators can update or correct the details of an existing system user. In this activity, the admin is presented with an editable form containing the user's current information, which can be modified as needed such as updating the name, role, or account status. Once all necessary changes have been made, clicking Save confirms the updates and redirects the admin to the System Users screen, now displaying the revised information. If the admin chooses not to proceed with the edits, selecting Cancel will discard any changes and return them to the System Users section. This activity ensures accurate and efficient maintenance of user accounts within the system.

Figure 25. Delete User (Admin)

This figure illustrates the delete confirmation workflow for system users. When an administrator attempts to delete a user account, the system displays a warning message to confirm the action and prevent accidental deletions. The message provides two options: Yes, Delete and Cancel. If the admin selects Yes, Delete, the user account is permanently removed, and the User Management screen is updated to reflect this change. If Cancel is selected, the deletion is aborted, and the system returns to the System Users screen without making any changes. This workflow ensures careful management of user accounts and minimizes the risk of unintentional deletions.

Figure 26. Procedures Log (Admin)

This figure presents the Admin's Procedure Log, which provides a comprehensive record of all completed procedures. The admin can refine the displayed data using filters such as exact date, date range, clinician, clinical instructor, patient details (name, age, sex), chair number, and status. After selecting the desired criteria, clicking Apply Filters will display the corresponding results. Additionally, the Admin can quickly view reports for today only, show all records, or export the filtered data to a CSV file for external use.

Figure 27. Dashboard (Clinician)

This figure illustrates the main activity within the Clinician Dashboard, which serves as the central hub for managing patient-related tasks. From this dashboard, clinicians can navigate to the Profile Screen to view or update their own account information, or to the Add Patient Screen to register new patients. Additionally, clinicians can interact with existing patient records, performing actions such as viewing detailed information, editing or updating records, and modifying the status of a specific patient's information. This activity provides clinicians with streamlined access to essential tools, ensuring efficient management of patient data and supporting accurate and timely healthcare documentation.

Figure 28. Dashboard (Clinician)

This figure illustrates a continuation of the Clinician Dashboard, highlighting the filtering and search functionalities available to clinicians. Users can filter patient records by entering a patient’s name, specifying a “Date From” and “Date To” range, and selecting the status of the patient. These features allow clinicians to quickly locate specific patient records, narrow down large datasets, and efficiently manage and review relevant patient information. By providing flexible filtering options, the dashboard enhances usability and supports effective workflow management in patient care.

Figure 29. Patient Section (Clinician)

This figure illustrates the main activity within the Patient section for Clinicians, where clinicians can efficiently manage patient records. In this activity, clinicians are able to interact with individual patient records, performing actions such as viewing detailed information, editing or updating patient data, and modifying the status of a specific Patient Information Record. This functionality allows clinicians to maintain accurate and up-to-date patient information, supporting informed decision-making and ensuring continuity of care.

Figure 30. Patient Section (Clinician)

This figure illustrates a continuation of the Clinician Patient section, highlighting the filtering and search functionalities available to clinicians. Users can filter patient records by entering a patient’s name, specifying a “Date From” and “Date To” range, and selecting the status of the patient. These features allow clinicians to quickly locate specific patient records, narrow down large datasets, and efficiently manage and review relevant patient information. By providing flexible filtering options, the dashboard enhances usability and supports effective workflow management in patient care.

Figure 31. Dashboard (CI)

This figure illustrates the main activity in the CI or Clinic Instructor Dashboard. This illustrates what CI is allowed to do in the activity, CI is only allowed to view records, edit status of approving patients, transfer patients, and generate reports.

Figure 32. Patient section (CI)

This figure illustrates the patient section of CI. The figure illustrates what CI is allowed to do in the activity, CI is only allowed to view records, edit status of approving patients, transfer patients, and generate reports.

Figure 33. Patient Information Review (CI)

This figure illustrates the first page of the Patient Information Record (PIR), which serves as the main activity for CI. In this activity, the CI has several key functionalities: they can approve or decline patient records, view details of existing patients, and generate reports based on the recorded data. This page provides a centralized interface that enables CIs to manage and monitor patient information efficiently, ensuring proper oversight, validation, and documentation within the system.

Figure 34. Edit Patient Status (CI)

This figure illustrates the edit patient status activity, the CI interacts with a dropdown that illustrates options including, Pending, Approve, and Decline. Once CI clicks update status it will redirect to updated Patient status. In addition, a Progress notes screen where CI can give remarks to a completed procedure.

Figure 35. Transfer Assigned Patient (CI)

This figure illustrates the process of transferring assigned patients between CI. In this activity, a Clinical Instructor can select patients currently assigned to them and reassign these patients to another Clinical Instructor as needed. This functionality ensures proper workload distribution and efficient management of patient assignments, while maintaining accurate records and supporting collaboration among clinical instructors for effective patient care.

Figure 36. Patient Transfers Section (CI)

This figure illustrates the Patient Transfer Section; CI interacts with incoming Requests from another CI. CI clicks View details, once Accept is clicked the patient will be redirected to the patient section. Otherwise, the Reject button, once clicked, the patient is rejected.

Figure 37. Outgoing Requests (CI)

This figure illustrates the Outgoing requests of CI, display options including View Details, and Cancel. The CI clicks the View details and displays the patients details and cancels transfer if the transfer is not needed.

Figure 38. Transfer History (CI)

This figure illustrates the Transfer History of Patients for Clinical Instructors (CIs). In this activity, a CI can view the complete history of patient transfers, including both patients received from other instructors and patients they have transferred to others. This feature provides transparency and accountability in patient management, allowing CIs to track past assignments, monitor transfer activities, and maintain accurate records for effective coordination and continuity of care.

Figure 39. View Details (CI)

This figure illustrates the activity where a Clinical Instructor (CI) views patient details. In this activity, the CI can access comprehensive information about a specific patient, including personal information, medical history, and other relevant records. This functionality allows the CI to review and verify patient data, ensuring accurate monitoring and informed decision-making for patient care and management.

Figure 40. Accept Transfer (CI)

This figure illustrates the Accept Transfer screen, which is used by a Clinical Instructor (CI) when accepting a patient reassigned from another CI. In this activity, the CI reviews the details of the incoming patient and confirms the transfer by interacting with the system. This process ensures proper handover of patient responsibilities, maintains accurate assignment records, and supports continuity of care between Clinical Instructors.

Figure 41. Reject Transfer (CI)

This figure illustrates the Reject Transfer screen, which is used by a Clinical Instructor (CI) when declining a patient reassigned from another CI. In this activity, the CI can review the details of the proposed transfer and choose to reject it if necessary. This process ensures that patient assignments are only accepted when appropriate, helps maintain accurate records of patient management, and supports proper communication and workflow between Clinical Instructors.

Figure 42. Patient Assignment Section (CI)

This figure illustrates the Patient Assignment section for Clinical Instructors (CIs). In this section, the CI can interact with options such as View (represented by an eye icon) and Review. Selecting View allows the CI to access the full multipage Patient Information Record (PIR), providing detailed patient data for review. Selecting Review displays the patient's basic information along with actionable options to accept or reject the patient assignment. This section streamlines the process of managing patient assignments, ensuring that CIs can make informed decisions while maintaining accurate records of patient allocations.

Figure 43. Review Patient Assignment (CI)

This figure illustrates the Review patient assignment, CI interacting with this activity once accepting or rejecting a patient assigned by the COD.

Figure 44. Dashboard (COD)

This figure illustrates the Clinician on Duty (COD) Dashboard, which serves as the central hub for managing daily clinical responsibilities. From this dashboard, the COD can access their profile, manage patient assignments, and search for patients using filters such as name, date, or status. This activity provides the COD with a comprehensive overview of their tasks, enabling efficient monitoring, organization, and management of patient records and assignments during their duty.

Figure 45. Patient Section (COD)

The figure illustrates the COD Patient section, the COD manages patient assignments, or search for patients by name, date, or status.

Figure 46. Patient Assignment Section (COD, Admin)

This figure illustrates the Patient Assignment section for the Clinician on Duty (COD). In this activity, the COD can automatically and evenly assign patients to each Clinical Instructor (CI) and reassign patients as needed to ensure balanced workloads. Additionally, the COD has the ability to add new CIs to the assignment pool, allowing the system to update and accommodate staff changes. This functionality supports efficient patient management, ensures fair distribution of responsibilities, and maintains accurate records of patient assignments.

Figure 47. Log Procedure Assignment Section (COD, Admin)

This figure illustrates the Log Procedure Assignment section for the Clinician on Duty (COD). In this activity, the COD can automatically and evenly assign new clinical procedures for patients to each Clinical Instructor (CI), ensuring balanced workloads and efficient management of clinical tasks. The COD can also reassign procedures if adjustments are needed and has the ability to add new CIs to the assignment pool, allowing the system to adapt to staff changes. This functionality ensures that all procedures are properly distributed, tracked, and managed within the clinical workflow.

Figure 48. Add CI to Pool (COD, Admin)

This figure illustrates the Add Clinical Instructor (CI) screen, which is used by the Clinician on Duty (COD) when adding a CI to the assignment pool. In this activity, a dropdown menu displays the list of available CIs, from which the COD can select a specific CI to include in the pool. This functionality allows the COD to efficiently update the CI roster, ensuring that patient and procedure assignments can be distributed accurately and evenly among all active instructors.

Figure 49. Reassign Patient (COD, Admin)

This figure illustrates the Reassign Patient screen, which is used by the Clinician on Duty (COD) when a patient assignment has been rejected by a Clinical Instructor (CI). In this activity, the COD can select an alternative CI from the assignment pool to reassign the patient, ensuring that the patient is properly managed and attended to. This functionality helps maintain accurate records of patient assignments, supports workflow continuity, and ensures that all patients receive timely care despite initial rejections.

Figure 50. Profile (Admin, Clinician)

This figure illustrates the Profile of Admin and Clinician, Users can upload images and edit information. In addition, once a changed password is clicked, the user will be redirected to the settings section, and once add new patient is clicked it will redirect to patient section.

Figure 51. Profile (CI, COD)

This figure illustrates the Profile section for both Clinical Instructors (CIs) and the Clinician on Duty (COD). In this activity, users can upload profile images and edit personal information to keep their account details up to date. Additionally, if the user selects the Change Password option, they are redirected to the Settings section, where they can securely update their login credentials. This functionality ensures that user profiles remain accurate, personalized, and secure.

Figure 52. Upload Profile (Admin, Clinician, CI, COD)

This figure illustrates the Upload Profile screen, where users can select a file from their device's file browser and upload it as their profile image. This activity allows users to personalize their accounts by adding a visual identifier, ensuring that profile information is complete and easily recognizable within the system.

Figure 53. Edit Profile (Admin, Clinician, CI, COD)

This figure illustrates the Edit Profile activity, where users can modify their personal information such as name, contact details, or other account-related data. Once the necessary changes have been made, the user can click Save to update their profile. This activity ensures that user information remains accurate, up-to-date, and properly maintained within the system.

Figure 54. Settings (Admin, Clinician, CI, COD)

This figure illustrates the Settings section, which provides users with options to manage their account preferences and security settings. In this section, users can change their default password to a new, secure one, ensuring that their account remains protected against unauthorized access. This functionality is a critical aspect of maintaining account security and personalizing user access. In addition to password changes, the Settings section may include other account-related controls, giving users centralized management over their personal information and security settings within the system.

Figure 55. Generate Report (Admin, Clinician, CI, COD)

This figure illustrates the Generated Report page, where users can view and manage reports generated by the system. The page includes a “Select All” button that allows users to quickly select all report pages for printing. Additionally, users can choose specific pages from a set of five available options, enabling them to print only the pages they need. By clicking the Print button, the system prints the selected pages, providing flexibility and control over report management while ensuring efficient use of resources.

SCREEN LAYOUTS

Figure 56. Log in Screen

This figure illustrates the login screen, prompting users to enter their username and password. This serves as the landing page upon launching the iDENTify system.

Figure 57. Dashboard (Admin)

This figure illustrates the Dashboard of the Admin account. The dashboard features statistical graphs and Performance Indicators including the Total Patients, Total Records, Today Submission and Active Medical Alert.

Figure 58. Patient Section (Admin)

This figure illustrates the Patients Tab. It contains the Patients Section where the user can Add new patients and search for them. The user can also see the ID, age, Phone number, email, date created procedure details and the states of the patient. It also features an action button where the user can view, edit and delete.

Figure 59. Viewing Patient Record 1st page (Admin)

This figure illustrates the first page of Viewing Patient Record. It is one of the action buttons that illustrates Personal Data, Health Questionnaire, Dental Examination, Informed Consent and Progress Notes.

The screenshot displays the 'Personal Data' tab of a patient record. The 'Personal/Social History' section shows 'None'. The 'Review of Systems' section contains a grid of status boxes for various body systems, all marked 'Good'. The 'ASA Classification' section shows 'ASA Class' as 'Class II' and 'Notes' as 'N/A'.

Review of Systems

INFORMED CONSENT:

Patient's name: Kent Harold Age / Gender: 21 / Male

TREATMENT TO BE DONE. I understand and consent to have any treatment done by the dentist after the procedure, the risk & benefits and cost have been fully explained. These treatments include, but are not limited to, oral surgery, cleaning, periodontal treatments, fillings, crowns, bridges, and prosthodontic, root canal treatments and orthodontic treatments, and all minor and major dental procedures. Initial: _____

DRUGS & MEDICATIONS. I understand that antibiotics, analgesics and other medications can cause allergic reactions (redness, swelling of tissues, pain, itching, vomiting, and/or anaphylactic shock). Initial: _____

CHANGES IN TREATMENT PLAN. I understand that during treatment, it may be necessary to change or add procedures because of conditions found while working on the teeth that were not discovered during examination. For example, root canal therapy may be necessary following routine restorative procedures. I give my permission to the dentist to make any/all changes and additions as necessary. Initial: _____

RADIOGRAPHS. I understand that x-rays (radiographs) may be necessary to complete and/or diagnose the tentative diagnosis of my dental problem. I give my permission to have such radiographs taken. Initial: _____

REMOVAL OF TEETH. I understand that alternatives to tooth removal (root canal therapy, crowns & periodontal surgery, etc.) and I agree to the removal of teeth if necessary. Removing teeth does not always remove all the infection, if present, and it may be necessary to have further treatment. I understand the risks involved in tooth removal, some of which are pain, swelling, spread of infection, dry socket, loss of feeling in my teeth, lips, tongue and surrounding tissue (paresthesia) that can last for an indefinite period of time or fractured jaw. I understand that I may need further treatment by a specialist if complications arise during or following treatment, the cost of which is my responsibility. Initial: _____

CROWNS, CAPS, BRIDGES. I understand that sometimes it is not possible to match the color of natural teeth exactly with artificial teeth. I further understand that I may be wearing temporary crowns, which may come off easily and that I must be careful to ensure that they are kept on until the permanent crowns are delivered. I realize the final opportunity to make changes in my new crown, bridge, or cap (including shape, fit, size, and color) will be before cementation. It is also my responsibility to return for permanent cementation within 20 days from tooth preparation. Excessive delay may allow for decay, tooth movement, gum disease, or other problems. If I fail to return within this time, the dentist is not responsible for any problems resulting from my failure to return. Initial: _____

Figure 76. Editing Patient Record 4th page (Admin)

This figure illustrates the fourth page of Editing Patient Record. Within this page is the informed consent and the patient needs to sign it to continue to the next page.

DATA PRIVACY CONSENT

I hereby declare that by signing:

INFORMED CONSENT:

Patient's name: Kent Harold Age / Gender: 21 / Male

TREATMENT TO BE DONE: I understand and consent to have any treatment done by the dentist after the procedure, the risk & benefits and cost have been fully explained. These treatments include, but are not limited to, oral surgery, cleaning, periodontal treatments, fillings, crowns, bridges, and prosthodontic, root canal treatments and orthodontic treatments, and all minor and major dental procedures. Initial: _____

DRUGS & MEDICATIONS: I understand that antibiotics, analgesics and other medications can cause allergic reactions (redness, swelling of tissues, pain, itching, vomiting, and/or anaphylactic shock). Initial: _____

CHANGES IN TREATMENT PLAN: I understand that during treatment, it may be necessary to change or add procedures because of conditions found while working on the teeth that were not discovered during examination. For example, root canal therapy may be necessary following routine restorative procedures. I give my permission to the dentist to make any/all changes and additions as necessary. Initial: _____

RADIOGRAPHS: I understand that x-rays (radiographs) may be necessary to complete and/or diagnose the tentative diagnosis of my dental problem. I give my permission to have such radiographs taken. Initial: _____

REMOVAL OF TEETH: I understand that alternatives to tooth removal (root canal therapy, crowns & periodontal surgery, etc.) and I agree to the removal of teeth if necessary. Removing teeth does not always remove all the infection, if present, and it may be necessary to have further treatment. I understand the risks involved in tooth removal, some of which are pain, swelling, spread of infection, dry socket, loss of feeling in my teeth, lips, tongue and surrounding tissue (paresthesia) that can last for an indefinite period of time or fractured jaw. I understand that I may need further treatment by a specialist if complications arise during or following treatment, the cost of which is my responsibility. Initial: _____

CROWNS, CAPS, BRIDGES: I understand that sometimes it is not possible to match the color of natural teeth exactly with artificial teeth. I further understand that I may be wearing temporary crowns, which may come off easily and that I must be careful to ensure that they are kept on until the permanent crowns are delivered. I realize the final opportunity to make changes in my new crown, bridge, or cap (including shape, fit, size, and color) will be before cementation. It is also my responsibility to return for permanent cementation within 30 days from tooth preparation. Excessive delay may allow for decay, tooth movement, gum disease, or other problems. If I fail to return within this time, the dentist is not responsible for any problems resulting from my failure to return. Initial: _____

Informed Consent

INFORMED CONSENT:

Patient's Name: Kent Harold Age / Gender: 21 / Male

Consent Statements & Acknowledgments

TREATMENT TO BE DONE
I understand and consent to have any treatment done by the dentist after the procedure, the risk & benefits and cost have been fully explained. These treatments include, but are not limited to, oral surgery, cleaning, periodontal treatments, fillings, crowns, bridges, and prosthodontic, root canal treatments and orthodontic treatments, and all minor and major dental procedures.

Patient Initial: Not Initialed

DRUGS & MEDICATIONS
I understand that antibiotics, analgesics and other medications can cause allergic reactions (redness, swelling of tissues, pain, itching, vomiting, and/or anaphylactic shock).

Patient Initial: Not Initialed

CHANGES IN TREATMENT PLAN
I understand that during treatment, it may be necessary to change or add procedures because of conditions found while working on the teeth that were not discovered during examination. For example, root canal therapy may be necessary following routine restorative procedures. I give my permission to the dentist to make any/sell changes and additions as necessary.

Patient Initial: Not Initialed

Figure 134. Viewing Patient Record 4th page (CI)

This figure illustrates the Viewing Patient Record multipage interface for the Clinical Instructor role. When the user clicks the View button, the system displays the corresponding multipage screen. The figure represents the fourth page out of five.

PERIODONTAL DISEASE
I understand that periodontal disease is a serious condition causing gums & bone inflammation and/or loss and that can lead to the loss of my teeth. I understand that alternative treatment plans to correct periodontal disease, including gum surgery tooth extractions with or without replacement. I understand that undertaking these treatments does not guarantee the elimination of the disease.

Patient Initial: Not Initialed

DENTURES
I understand the wearing of dentures is difficult. Sore spots, altered speech, and difficulty in eating are common problems. Immediate dentures (placement of dentures immediately after extractions) may be uncomfortable. I realize that dentures may require adjustments and relining (at additional cost) to fit properly.

Patient Initial: Not Initialed

FILLINGS
I understand that care must be exercised in chewing on fillings during the first 24 hours to avoid breakage. I understand that a more extensive filling than originally diagnosed may be required due to additional decay found during preparation. I understand that significant sensitivity is a common but usually temporary after effect of a newly placed filling.

Patient Initial: Not Initialed

GENERAL DISCLAIMER
I understand that dentistry is not an exact science and that no dentist can properly guarantee results. I hereby authorize any of the dentists to proceed with and perform the dental treatments & treatments as explained to me. I understand that dentistry is subject to medication depending on my individual circumstances that may arise during the course of treatment. I further understand that regardless of any dental insurance coverage I may have, I am responsible for payment of dental fees. I agree to pay my estimated portion and any costs or fees not covered by my insurance company at the time services are rendered. I understand that any unpaid balance will accrue interest and that any unpaid account may be referred to a collection agency. I understand that any dental work that remains unpaid for more than 30 days after billing will be subject to additional charges. I understand that adjustments of any kind after this initial period will be my responsibility.

Patient Initial: Not Initialed

This figure illustrates the Transfer Patient Request window; within this section the user can View the details of the request and accept or reject it.

Figure 143. View Details (Other CI)

This figure illustrates the dialogue box of Transfer Request when the user clicks the View Details Button.

Figure 144. Accept Transfer (Other CI)

This figure illustrates the Accept Transfer Request dialogue box when the user clicks the Accept Button.

Figure 145. Reject Transfer (Other CI)

This figure illustrates the Reject Transfer Request dialogue box when the user clicks the Reject Button.

Figure 146. Patient Assignment Section (CI)

This figure illustrates the Patient Assignment section, where the user can assign patients to other clinicians.

Figure 147. Patient Assignment Review (CI)

This figure illustrates the Review Patient Assignment dialogue box when the user clicks the Review button. This is where the user can Deny or Accept the Transfer Request.

Figure 148. Profile Section (CI)

This figure illustrates the My Profile Section for Clinical Instructor Role. Within this section the user can modify their Profile and edit the information. The user can also upload a Profile Picture through the Upload button. In addition, the Role permissions of the user is also displayed here.

Figure 149. Upload Profile (CI)

This figure illustrates the dialogue box that appears when a user chooses to upload a profile picture. In this activity, users are prompted to select a file from their device, providing a clear interface for choosing and confirming the image to be uploaded. This dialogue box ensures a straightforward and guided process for updating the profile picture, allowing users to personalize their accounts efficiently and accurately.

5.0 CONCLUSIONS AND RECOMMENDATIONS

This research applied the identified conclusions and recommendations to enhance the iDENTify system. Based on the findings, the researchers developed solutions to improve dental patient data management and treatment tracking.

CONCLUSIONS

The study aimed to provide efficient, and reliable solution to address the challenges faced in managing dental patient records at the Lyceum of the Philippines University–Batangas College of Dentistry. By developing iDENTify: Dental Patient Information and Treatment Tracker, the system was able to respond to the need for a unified and organized platform that improves the recording, access, and monitoring of patients' data and treatment details.

1. The successful development and implementation of the web-based system prove its efficacy in addressing the objectives of the study. The system important features, including the management of patient information, tracking of treatments, logging new clinical

procedure, and generation of reports, indicates a properly designed and functional system that meets the institutional needs of the College of Dentistry. Such features are collectively supportive of students and faculty in record keeping and monitoring case progress with greater efficiency.

2. The research shows that these goals resulted in significant improvements in managing patient records and clinical documentation. The system offers an organized digital space that users can easily access. It enables them to refresh, update, and manage patient data more effectively. The dental program also benefits from the system's ability to create patient histories and track ongoing treatments. This improves clinical decision-making and case management.
3. The development process involves HTML, CSS, JavaScript, PHP, and MySQL. This illustrates how modern web technologies can work in academic and clinical

settings. These tools help build a platform that is responsive, easy to use, and reliable. This demonstrates dental education's commitment to using current technology to improve workflows.

Strengthening these internal safeguards will help maintain system performance, ensure long-term data stability, and protect the confidentiality of patient records.

RECOMMENDATIONS

1. This dental patient information record and treatment tracking system can serve as a reference for future researchers. It aims to improve its user interface and strengthen its functionality. These changes will support clinical documentation and monitoring more effectively.
2. Additional features that could be added to improve its purpose include better dental charting, treatment analysis, and automated reminders. This would make iDENTify more of a dental record management application.
3. Future developers should consider improving the system's data management by adding stronger backup protocols, better database optimization, and more reliable user-permission controls.
